BASIC-ABSTRACT:

The media information delivery system delivers a media information from a centre device (10) to a terminal (12). A media information storage part (21) stores the media information. A first receiving part receives a delivery demand of a media information from a terminal receiving part. A reference part responds to the delivery demand received from the first receiving part by searching the media information in the storage part. A first transmitting part transmits the media information searched by the reference part, to the terminal transmitting part.

A selection part of the terminal, selects the media information that performs a delivery demand. A second transmitting part transmits the delivery demand of the media information, selected by the selection part to the centre device. A second receiving part receives the media information transmitted from the centre device. A medium recognition part distinguishes whether the memory medium in which the media information is recorded in a regular memory medium. A recording part records the media information received from the second receiving part.

USE/ADVANTAGE - In delivering media information such as music, video program through public telecommunication network, exclusive network. Provides reliable protection of copyright.

ABSTRACTED-PUB-NO: JP10177767A

BASIC-ABSTRACT:

The method involves sending a demand signal to a host (608) from a PC (603). After receiving an ISRC code and SID code, the SID code is judged whether it is genuine or not. When it is confirmed to be genuine, the billing of copyright to user code takes place and a recording enable signal is transmitted to the PC.

The received signal is sent to the recording and reproducing apparatus and copy is approved on the other hand. When a recording disapproval signal is received then the recording and reproduction apparatus (500a, 500b) is made reactive and the copy is not approved.

ADVANTAGE - Suppresses manufacture of pirate board. Performs billing by simple copy protection key.

BASIC-ABSTRACT:

The coin in the slot apparatus retails recordings of sound or pictures as gramophone records or tape recordings. The purchaser is able to select any desired recording and receive it in new unplayed condition, or to select only one recording from a set of a number of recordings. The whole of the available recordings are stored in a master stock and means are provided for the purchaser to select the recording required, and normally after insertion of a coin, to have it re-recorded as his purchase on a blank which may either be supplied by the machine or by the purchaser himself. After provision of the blank, selection of the required recording, and insertion of the coin, the re-recording may be effected at a speed greater than the normal playing speed.
